

**Statistics 1:  
Introduction to  
Probability and Statistics  
Section 1-4**

---

---

---

---

---

---

---

**Design of Experiments**

- **Definitions**
- **Five different approaches to sampling**

---

---

---

---

---

---

---

**Recap Scientific Method**

- **Identify hypothesis and popul.**
- **Plan for collecting data**
- **Collect the data**
- **Analyze the data**
- **Draw conclusions (revise hypothesis)**

---

---

---

---

---

---

---

## Scientific Method

---

---

---

---

---

---

---

---

## Definitions

- **Observational study**
- **Experiment**

---

---

---

---

---

---

---

---

## Definitions

- **Observational study:**  
observe (measure) items in the population but without manipulating or modifying the subjects under study

---

---

---

---

---

---

---

---

## Definitions

- **Cross Sectional Study**
  - Data are observed, measured, and collected at one point in time
  - A current “snapshot”

---

---

---

---

---

---

---

## Definitions

- **Retrospective (or Case Control) Study**
  - Data are collected from the past by going back in time
  - Learn from history

---

---

---

---

---

---

---

## Definitions

- **Prospective (“Longitudinal” or “Cohort”) Study**
  - Form groups (cohorts) that share common factors
  - Track cohort members through (future) time to collect informative data

---

---

---

---

---

---

---

## Definitions

- **Experiment:** we “treat” (manipulate / modify) then observe or measure the characteristic of interest. Assess the “effects” of the treatments.

---

---

---

---

---

---

---

---

## Definitions

- **Placebo effect**
- **Blinding**

---

---

---

---

---

---

---

---

## Definitions

- **Placebo effect**
  - A response due to the “belief” that one is receiving a particular treatment

---

---

---

---

---

---

---

---

## Definitions

- **Blinding**
  - practice of preventing a subject from “knowing” how they are being treated
  - practice of preventing the investigator from knowing also (double blind)

---

---

---

---

---

---

---

---

## Definitions

- **Blocking**
- **Confounding**

---

---

---

---

---

---

---

---

## Definitions

- **Blocking**
  - grouping similar items together
  - powerful and simple practice

---

---

---

---

---

---

---

---

## Definitions

- **Confounding**
  - usually undesirable situation in which an extraneous factor is associated with the factor one is studying

---

---

---

---

---

---

---

---

## Definitions

- **Confounding example**
  - Are teachers better at school A than at school B?
  - But school A is a private school for poor kids and school B is a public school in a rich neighborhood.

---

---

---

---

---

---

---

---

## Definitions

- **Confounding example**
  - What have you learned when school A students do better than school B students?
  - Is it the teachers, the administration, or the students?

---

---

---

---

---

---

---

---

## Definitions

- **Replication**
- **Randomization**

---

---

---

---

---

---

---

---

## Definitions

- **Replication**
  - repetition of an experiment
  - repeating the same conditions to see whether the response is consistent

---

---

---

---

---

---

---

---

## Definitions

- **Randomization**
  - Selecting items or assigning items to treatments so all possible selections or assignments are equally likely

---

---

---

---

---

---

---

---

## Five Sampling Methods

- (Simple) Random Sampling
- Stratified (Random) sampling
- Systematic sampling
- Cluster sampling
- Convenience sampling

---

---

---

---

---

---

---

## Simple Random Sampling

- Every element in the population is equally likely to be in sample.

And

- Every possible sample of size  $N$  has the same chance of being chosen.

---

---

---

---

---

---

---

## Stratified Sampling

- Subdivide the population into two or more subgroups (strata)
- Elements in each subgroup (stratum) share some common feature
- Select random samples within each of the strata

---

---

---

---

---

---

---

## **Systematic Sampling**

- Select a starting point
- Then select every  $k^{\text{th}}$  element in the population, or some other structured method of selecting the sample

---

---

---

---

---

---

---

---

## **Cluster Sampling**

- Identify groups of elements in the population that naturally cluster together
- Randomly select clusters (not single elements)
- Observe / measure ALL elements in the selected clusters

---

---

---

---

---

---

---

---

## **Convenience Sampling**

Observe and measure elements in the population that are

- Convenient
- Readily available
- Cheap to acquire

May occur in combination with other “designs”

---

---

---

---

---

---

---

---

## **Convenience Sampling with Other Designs**

- **Random selection of potential survey participants, but only those who “volunteer” will participate**
- **Stratified population, but selection of elements within each stratum is based on convenience**

---

---

---

---

---

---

---

---
