## Conditional probability using counts instead of probabilities College students

Undergraduates at a 4-year university are classified by year (1st-year, 2nd, 3rd, 4th) and living status (on-campus and off-campus). See the table.

|  | 1st-year | 2nd-year | 3rd-year | 4th-year |
| :--- | :--- | :--- | :--- | :--- |
| On-campus | 4253 | 2861 | 1727 | 585 |
| Off-campus | 934 | 1829 | 2487 | 3918 |

1) How many students live on campus? Off campus?
2) How many students are 1st-year? Second year? Third? Fourth?
3) How many undergraduates attend the school?
4) If a student is chosen at random, what is the probability that he/she is 2 nd year?
5) If a student is chosen at random, what is the probability that he/she lives off campus?
6) If a student who lives off campus is chosen at random, what is the probability that he/she is 2 nd year? What is the probability that he/she is not 2 nd year?
7) If a 2nd-year student is chosen at random, what is the probability that he/she lives off campus? What is the probability that he/she lives on campus?

## Conditional probability: Dogs and Fleas

A: The household has dogs (at least one dog).
B: The household has fleas.

* Assume 60\% of households have dogs. Thus, $40 \%$ do not. $\mathrm{P}(\mathrm{A})=0.6, \mathrm{P}(\operatorname{not} \mathrm{A})=0.4$
* Of households with dogs, 70\% have fleas, and 30\% do not.
(Translation: The probability that a household has fleas, given that it has dogs, is $70 \%$.) $\mathrm{P}(\mathrm{B} \mid \mathrm{A})=0.7, \mathrm{P}(\operatorname{not} \mathrm{B} \mid \mathrm{A})=0.3$
* Of households without dogs, $25 \%$ have fleas, and $75 \%$ do not.
(The probability that a household has fleas, given that it has no dogs, is $25 \%$.)
$\mathrm{P}(\mathrm{B} \mid \operatorname{not} \mathrm{A})=0.25, \mathrm{P}(\operatorname{not} \mathrm{B} \mid \operatorname{not} \mathrm{A})=0.75$

Q1: What percent of households have fleas?
$\mathrm{P}(\mathrm{B})=$
Q1A: What percent of households do not have fleas?
$\mathrm{P}(\operatorname{not} \mathrm{B})=$
Q2: Given that a household has fleas, what is the probability that it has dogs?
$\mathrm{P}(\mathrm{A} \mid \mathrm{B})=$
Q2A: Given that a household has fleas, what is the probability that it has no dogs?
$\mathrm{P}(\operatorname{not} \mathrm{A} \mid \mathrm{B})=$
Q3: Given that a household does not have fleas, what is the probability that it has dogs? $\mathrm{P}(\mathrm{A} \mid \operatorname{not} \mathrm{B})$

Q3A: Given that a HH does not have fleas, what is the probability that it has no dogs?
$\mathrm{P}(\operatorname{not} \mathrm{A} \mid \operatorname{not} \mathrm{B})$
